1- create a web page that open existing small window and scroll it's content to the end .
Then from console try the following:

      a- check if the small window still opened, close it.

      b- Try to write your name on the small window document using document.write (what is the problem).

      c- Now don't use document.write(Forbidden) instead use document.createElement to add your name inside a div and add that div to the small window's body.

2- Using document object method on the lecture's HTML page

      a- Find all images in page by two ways (document default collection and document methods).

      b- Find all options for City drop down list.

      c- Find all rows(tds) for second table in page.

      d- Find all elements that contain class name fontBlue and Bgrey.

3- Display the date with time on the document title (document.title) which changed every second to show time with date.
Note: use .toLocalString() method of the Date Object.

4- create img slider that changes the pictures every 4 seconds or when user presses button next/prev
